My Group

Started in 2012

A group of seven people are captured in mid-air, jumping joyfully with their arms raised. They are wearing bright green t-shirts, some with a circular logo that says "HCIL". The background shows a modern building with a curved facade and large windows, and a paved outdoor area. The overall mood is celebratory and energetic.

What if we could build clothes that revealed the inner-workings of the human body?

Research Questions

1. How can wearable sensing and visualization be used to support new types of body learning?
2. How do the on-body visual representations and animations affect engagement, exploration, and learning?
3. How can we draw links between learners' body systems and their everyday practices (e.g., "how is my heart affected by soccer practice?")?

WHAT IF OUR CLOTHES COULD SHOW HOW FAST WE RUN?

Research Questions

1. Can we create a lightweight, flexible display that doesn't physically interfere with running?
2. How does visualizing otherwise invisible performance data change the run experience?
3. What to display?
4. Could these displays be useful in group running or race contexts?

Social Fabric Fitness: The Design and Evaluation of Wearable E-Textile Displays to Support Group Running

ABSTRACT

Group exercise has multiple benefits including greater adherence to fitness regimens, increased enjoyment among participants, and enhanced workout intensity. While a large number of technology tools have emerged to support real-time feedback of individual performance, tools to support group fitness have been limited. One such tool is the flexible, wearable, e-textile display for running groups called *SFF: Flexible Fitness* (SFF). SFF provides a glanceable, shared screen on the back of the wearer's shirt to increase awareness and motivation of group fitness performance. We discuss parallel prototyping of three designs—one flexible e-link and two flexible LED-based displays; the selection and refinement of our design; and two evaluations—a field study and a laboratory study—of the tool with runners. Our qualitative findings indicate that SFF improves awareness of individual and group performance, helps groups stay together, and improves *in-situ* motivation. We close with reflections for future athletic e-textile displays.

INTRODUCTION

Since the 1990s, running has experienced unprecedented growth in the US [25,27]. Although typically seen as an individual activity, a growing number of runners are choosing to run in groups and/or joining running clubs [2]. Sports psychologists and coaches cite multiple benefits of group exercise, including greater adherence to exercise regimens, increased commitment to reach shared goals, and more intense workouts [15,14,24,33]. While a large number of tools have emerged to support real-time feedback of individual performance (e.g., Runkper, Nike[®]), we are unaware of work that investigates real-time tracking and feedback to support collective group fitness activities.

In this paper, we introduce a set of wearable electronic textile (e-textile) displays—called *Social Fabric Fitness (SFF)*—designed to increase performance awareness and motivation for group fitness (Figure 1). SFF is worn by one or two pace leaders in a running group; the displays wirelessly communicate with the wearer's mobile phone.

De submissão de C2022014, please do not distribute

Figure 2: The NFF system visualizes real-time run-tracking information as shared, dynamically reconfigurable displays to learners across scenarios.

and present real-time feedback about the group's activity (e.g., average pace, distance, and duration). Based on work in behavioural science on the motivational effects of goal setting and public commitment [15,26], SFF also compares current pace averages to a group-set target pace. While a number of previous is ubiquitous computing and HCI have focused on on-body sports sensing (e.g., [16,18,30]), only a few have provided real-time mobile-mediated feedback [16,22]. None have explored a shared, wearable display. Its runners aimed at enhancing group awareness, cohesion, and motivation.

As the first work exploring e-textile information displays for runners, our research questions are largely exploratory, including: what impact, if any, does SFF have on the women in terms of comfort, performance, self-awareness, and mental affect? How does SFF impact the group running experience—does it help support group awareness and/or cohesiveness? Finally, how does SFF compare to other tracking sensors (e.g., watch, mobile phone)?

To examine these questions, we designed, iterated on, and informally evaluated three flexible e-textile prototypes: two LED-based and one e-ink-based. During our iterative process, we focused primarily on viewability, comfort, size, weight, and display content, finally selecting the most promising design for further evaluation. We then performed a field study with 10 pre-existing running groups and two small case studies of SIF in race events. For the field study
