Accessibility for Inclusive Cities

UNIVERSITY of
WASHINGTON

A black and white photograph of a busy city sidewalk. In the foreground, a man in a dark jacket and cap walks towards the camera, wearing earbuds. To his left, a man in a plaid shirt and sunglasses walks. To his right, a woman with a cane walks. Further right, a young man is looking at his phone. The background shows other pedestrians and city buildings. A pedestrian crossing signal is visible on the right side of the sidewalk.

Are communities in the United States planning for pedestrians with disabilities? Findings from a systematic evaluation of local government barrier removal plans

Equitable planning

Cities with many pedestrian barriers can inhibit community mobility, access to services, and social participation for people with disabilities. Although National Disability Rights policies have been enacted in several nations, it is unclear what progress local governments have made in developing plans and implementing accessibility improvements to the pedestrian infrastructure. The purpose of this study was to evaluate the existence and quality of city plans used to remove barriers for pedestrians with disabilities. We conducted a systematic evaluation of American's with Disabilities Act (ADA) transition plans, for a stratified random sample of local cities and counties. An expert panel developed a quality appraisal tool that we used to evaluate plans. Among the 401 government entities reviewed, only 13% (54) had ADA transition plans readily available. Just seven of the 54 plans we acquired met all the minimum criteria required. Based on those reporting barriers, an average of 65% of curb ramps and 48% of sidewalks were not accessible. Many communities across the US have not developed ADA transition plans for pedestrian infrastructure or have developed low-quality plans. This case study provides insight on local level implementation of barrier removal plans whose lessons may apply inside and outside of the US.

1. Introduction

In communities around the world, people with disabilities experience multiple, interrelated barriers in the built environment that can lead to social exclusion and isolation. Barriers are encountered on pathways and routes that are used for walking/rolling in cities globally (Baris & Uslu, 2009; Gell, Rosenberg, Carlson, Kerr, & Betza, 2015; Haselwander et al., 2015; Mesur, 2013), as part of transportation (Rosenberg, Huang, Simonovich, & Betza, 2013), at community recreation sites (Rimmer, Riley, Wang, Rauworth, & Jurkowski, 2004; Vasudevan, 2016), and public buildings generally (Banda-Chalwe, Nitz, & De Jonge, 2014; Evell, 2009; Gleason, 1997). Based on the social model of disability and the International Classification of Functioning, Disability and Health (ICF), environmental barriers impacting the pedestrian environment are seen as a cause of disablement. State and local policy interventions that require improving access to walking/rolling on city pathways and other aspects of the built environment can facilitate numerous aspects of independent living, social participation, and employment for all people, and especially people with disabilities

(Hammel et al., 2015). Accessible communities benefit people with disabilities as well as older adults, both of whom represent growing populations around the world (Institute of Medicine, 2007; United Nations, 2001).

Several countries around the world have adopted national policies to address built environment barriers. Some countries address environmental barriers through antidiscrimination legislation, such as the Americans with Disabilities Act (ADA) in the US and the Disability Discrimination Act in the UK. It is also common for National, State, or local governments to adopt a set of building standards that require new construction and renovations to follow guidelines for accessible design of the physical environment (Imrie, 2000). Although the enactment of federal policies and the adoption of standards are notable benchmarks and significant achievements in improving accessibility internationally, sparse research to date has been conducted regarding the implementation of such policy related to the built environment at the State or local level.

It is unclear whether cities and other local governments have developed plans for removing environmental barriers to accessibility or

Dear Dr. Froehlich,

My name is Kie Fujii, and I am a third-year medical student at Hackensack Meridian School of Medicine in Nutley, NJ. I am a wheelchair user and I am currently working on a project at school to raise awareness and promote accessibility in my community. Since a local multiple sclerosis organization started an accessibility challenge to document obstructions of sidewalks, I have partnered with them to work on this project. While I was looking at different resources, I came across your work, Project Sidewalk, which aligns with what we are working on. If it is possible, we would like to implement your work in Bergen County of New Jersey. The multiple sclerosis organization has a monthly virtual meeting which the next meetings will be 12/15 and 1/19 at 7 PM EST. If you happen to be available on one of those days, we would love to hear more about your work. If not, I would like to still schedule an appointment with you.

Thank you so much for your time. I look forward to hearing from you soon.

Sincerely,
Kie

Congratulations and THANK YOU to the citizens of Newberg for putting in the work to map 100% of Newberg through [Project Sidewalk](#). That's over 107 miles covered with 264 local users who contributed to the data.

This information will be used to identify areas in Newberg that need sidewalks, need sidewalk repairs, and need to be updated to become more accessible. Through your efforts, Newberg can become a safer, more accessible community.

Looking to help? Verifications are still needed for the collected data. Click the link below to learn more.

Your work is making a difference

We did it! Users like you have mapped all 107 miles of Newberg, OR. However, we are not done. The more users who contribute, the better quality data. So start exploring today!

PROJECT SIDEWALK

Start MappingJon Froehlich

Access Features

This API serves point-level location data on accessibility features. The major categories of the features include: "Curb Ramp," "Missing Curb Ramp," "Obstacles," and "Surface Problem." You would occasionally find an accessibility feature like "No Sidewalk."

URL/v1/access/features

MethodGET

Parameters Required:

You need to pass a pair of latlng coordinates to define a bounding box, which is used to specify where you want to query the data from.

lat1=[double]

lng1=[double]

lat2=[double]

lng2=[double]

Success200

The API returns all the available accessibility features in the specified area as a Feature Collection of Point features.

Example/v1/access/features?lat1=38.909&lng1=-76.989&lat2=38.912&lng2=-76.982

Access Score: Streets

This API serves Accessibility Scores of the streets within a specified region. Accessibility Score is a numerical value between 0 and 1, where 0 means inaccessible and 1 means accessible.

URL/v1/access/score/streets

MethodGET

Parameters Required:

You need to pass a pair of latlng coordinates to define a bounding box, which is used to specify where you want to query the data from.

lat1=[double]

lng1=[double]

lat2=[double]

A city is only as accessible as its sidewalks. This map shows DC's are often blocked.

WALKING By Barbara Moreno (Guest Contributor) September 10, 2019 32

SHARE

A snapshot of sidewalk obstructions on NoMa's streets. by the author.

When Washingtonians like myself look for new apartments, we pay close attention to [the walk score](#) of a neighborhood. Any score upwards of 90 on a hundred point scale marks an area as a “walker’s paradise,” meaning major needs such as grocery stores and transit are within walking distance. However, what is *not* factored into the walkability score is the actual condition of the sidewalks.

PRESENTED BY:

The Makeability Lab at the University of Washington

GOAL:

Collect an open dataset on sidewalk accessibility in cities

TASK:

Find accessibility problems virtually using Google Street View

WHERE:

Online

DESCRIPTION:

Despite comprehensive civil rights legislation for Americans with disabilities, many city streets, sidewalks, and businesses remain inaccessible. Project Sidewalk, and our network of volunteers, plan to change that. Project Sidewalk is a web-based tool that allows anyone with a web browser and internet connection to contribute sidewalk accessibility information virtually using Google Street View. The data we collect is open and publicly available through our APIs. The data can be [See more](#)

HOW TO GET STARTED:

Good news! This is a SciStarter Affiliate project. You can earn credit in your [SciStarter Dashboard](#) for your participation.

Click the “**Visit**” button on this page. You will be directed to the project's website or app and invited to create a project account there. **Use the same email address (case sensitive!) you used to create your SciStarter account to join this project.**

Important to note:

1. On the mobile site, simply sign up or sign in and start validating accessibility issues labeled by other users.
2. On the desktop site, sign in/up and complete the tutorial, then you can either click Validate in the navbar to validate other users' labels, or you can click Explore to view Google Street View images and

YOUR MISSION

Validate 65 Obstacle in Path Labels

😊 CORRECT EXAMPLE

Obstacle in Path

Obstacles are barriers that impede **pedestrian pathways** for people using wheelchairs, walkers, or other mobility aids.

Not all fire hydrants, poles, and signs are obstacles—only those that clearly obstruct pedestrian paths.

“Being able to **virtually walk through a city**, easily collect data, and then to analyze that data (create heatmaps, etc.) is a **huge win** and helps better inform our planning. We just don’t have a way of collecting and looking at data at a holistic level. Staffing and resources is also a **huge constraint** for us.”

– City Planner

Considerations when Preparing for and Deploying to New Cities

Edit

New page

Jon Froehlich edited this page now · 21 revisions

[Project Sidewalk](#) is an open source project run by Professor Jon E. Froehlich, research scientist Michael "Mikey" Saugstad, and PhD and undergraduate students at the University of Washington.

From the beginning, our overarching vision has been to develop tools & techniques that semi-automatically map and assess all of the sidewalks in the world—using an intermixing of computer vision, machine learning, and crowdsourcing. As part of this vision, we are looking for new deployment cities outside of the US.

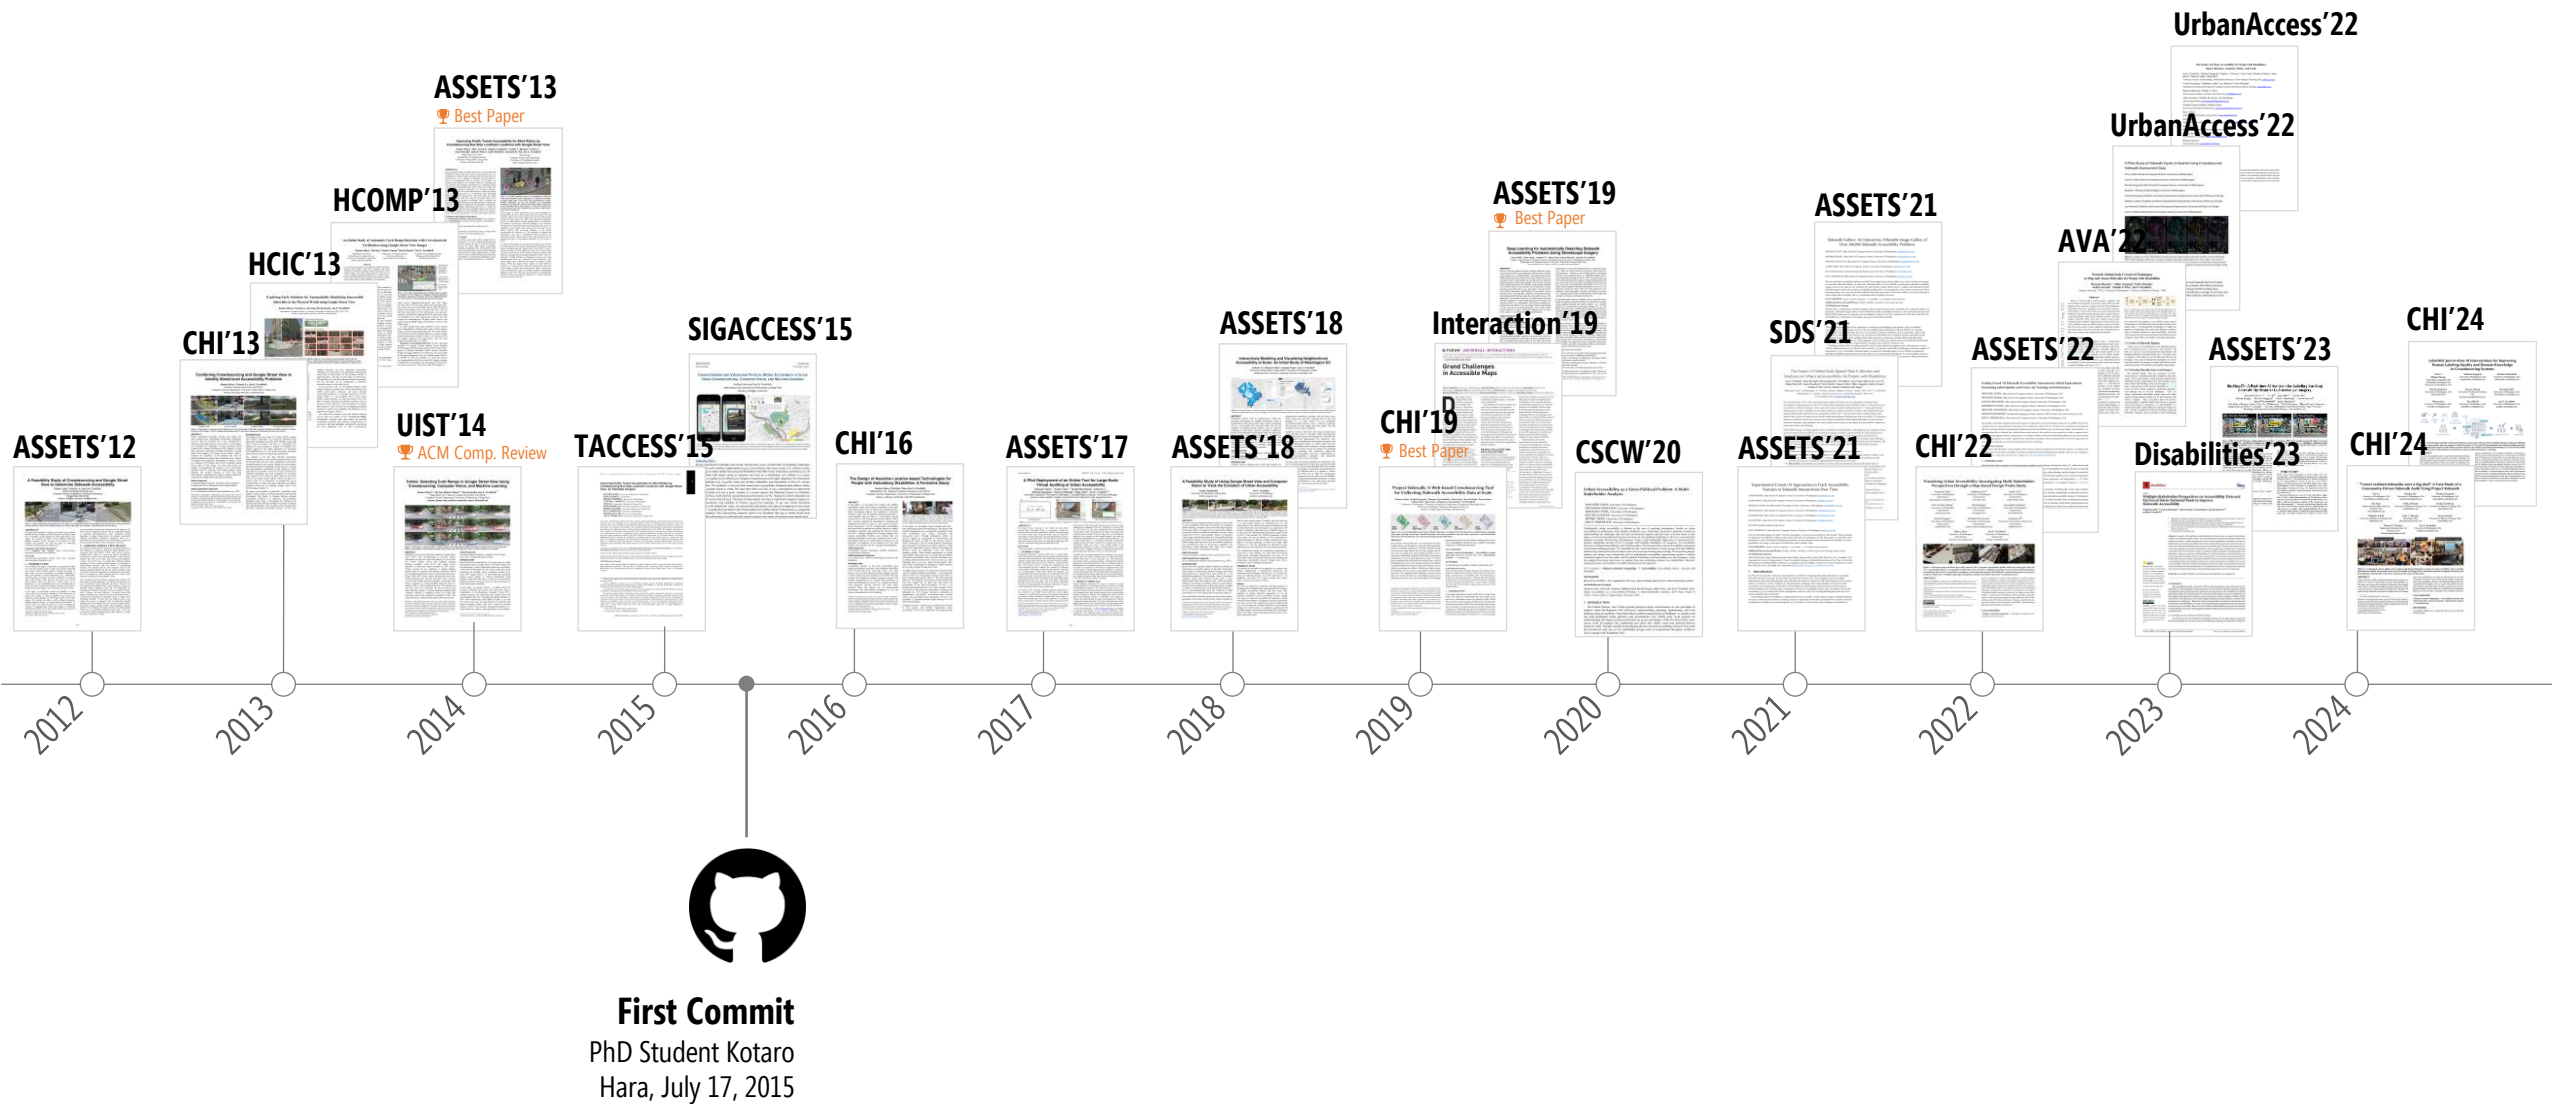

Based on our experiences deploying into cities in the US, the Netherlands, Mexico, Zurich, and beyond, here are our primary considerations:

- **Strong, active partners.** Most importantly, the presence of strong local advocates such as citizens, non-profit organizations, or government officials who can help us recruit and sustain communities of volunteers to help (e.g., to help run mapathons, to engage local schools and youth organizations, etc.). We want to *partner* with you to make this work. Ideally, we would also work with people with mobility disabilities in our deployment cities to help inform how to deploy and improve our tools and help impact change. As some examples:
 - In [Newberg, Oregon](#) we worked directly with local community accessibility advocates and the city government
 - In [San Pedro Mexico](#), we worked with a Mexico-based NGO called Liga Peatonal and the local government
 - In [Amsterdam](#) we worked with the local government and the organization [World Enabled](#)

Allen School's Michael Duan and Anas Awadalla recognized by CRA Outstanding Undergraduate Researcher Awards program

The Computing Research Association recently honored Allen School undergraduates [Michael Duan](#) and [Anas Awadalla](#) as part of its [Outstanding Undergraduate Researcher Awards program](#) for 2023. The annual program highlights exceptional undergraduate students from across North America for their contributions to the computing field.

Duan, who works with professor and advisor [Jon Froehlich](#) in the [Makeability Lab](#), was selected as a finalist for his work on [Scaling Crowd+AI Sidewalk Accessibility Assessments](#) and [Sidewalk Gallery: An Interactive, Filterable Image Gallery of Over 500,000 Sidewalk Accessibility Problems](#). The senior computer science major is the first undergraduate student in the lab's history to receive such an honor.

"It's really cool that I got a chance to be considered among other innovative and hardworking undergraduates," Duan said. "Their work is extremely inspiring to me, so I'm glad I got an opportunity to share my work alongside them."

Duan was first author on both projects. The first focused on automated sidewalk accessibility assessment with crowdsourced data. Together, Duan and his co-authors investigated using computer vision methods to determine and label the presence of accessibility features such as curb ramps in urban scenery — findings, he said, that can assist urban planners, disability advocates and city governments in designing smarter, more inclusive infrastructure.

The second project explored data visualization related to disability advocacy and urban planning. With the sheer amount of ever-increasing datasets, better ways of visualizing that data are needed. To tackle this problem, Duan and his collaborators introduced [Sidewalk Gallery](#), an interactive, filterable gallery of more than 500,000 crowdsourced sidewalk accessibility images across seven cities in two countries. The innovative interface allows users to browse and cull these images for different accessibility problem types, severity levels and more, providing a visualization aid and a teaching tool for
