shape memory alloys and 3D printable structure that is flexible in one deformation mode but stiff in the other deformation modes.

PROJECT BACKGROUND

3D PRINTING + MECHANICAL STRUCTURES

Prior work shows great potentials of making deformable objects with various fabrication techniques and materials.

However, they are not allowing people to harness the potential kinetic energy stored in deformation behaviors.

We are using **springs**...

Widely used mechanical mechanisms but not in 3D Printing

Offer expressive deformation behaviors

Lock and release potential kinetic energy

How can we...

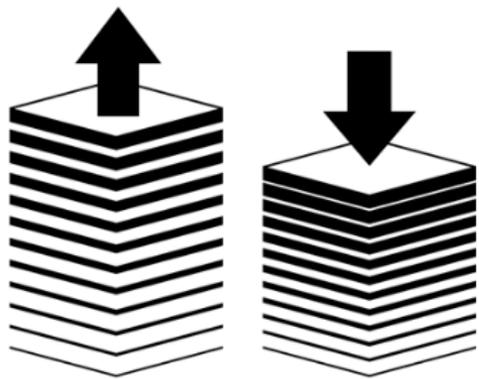

enable designers to rapidly build, simulate, and fabricate deformable 3D-printable objects with embedded mechanical springs?
